Cloud Networking. *Simplified.*

Network Management Historically

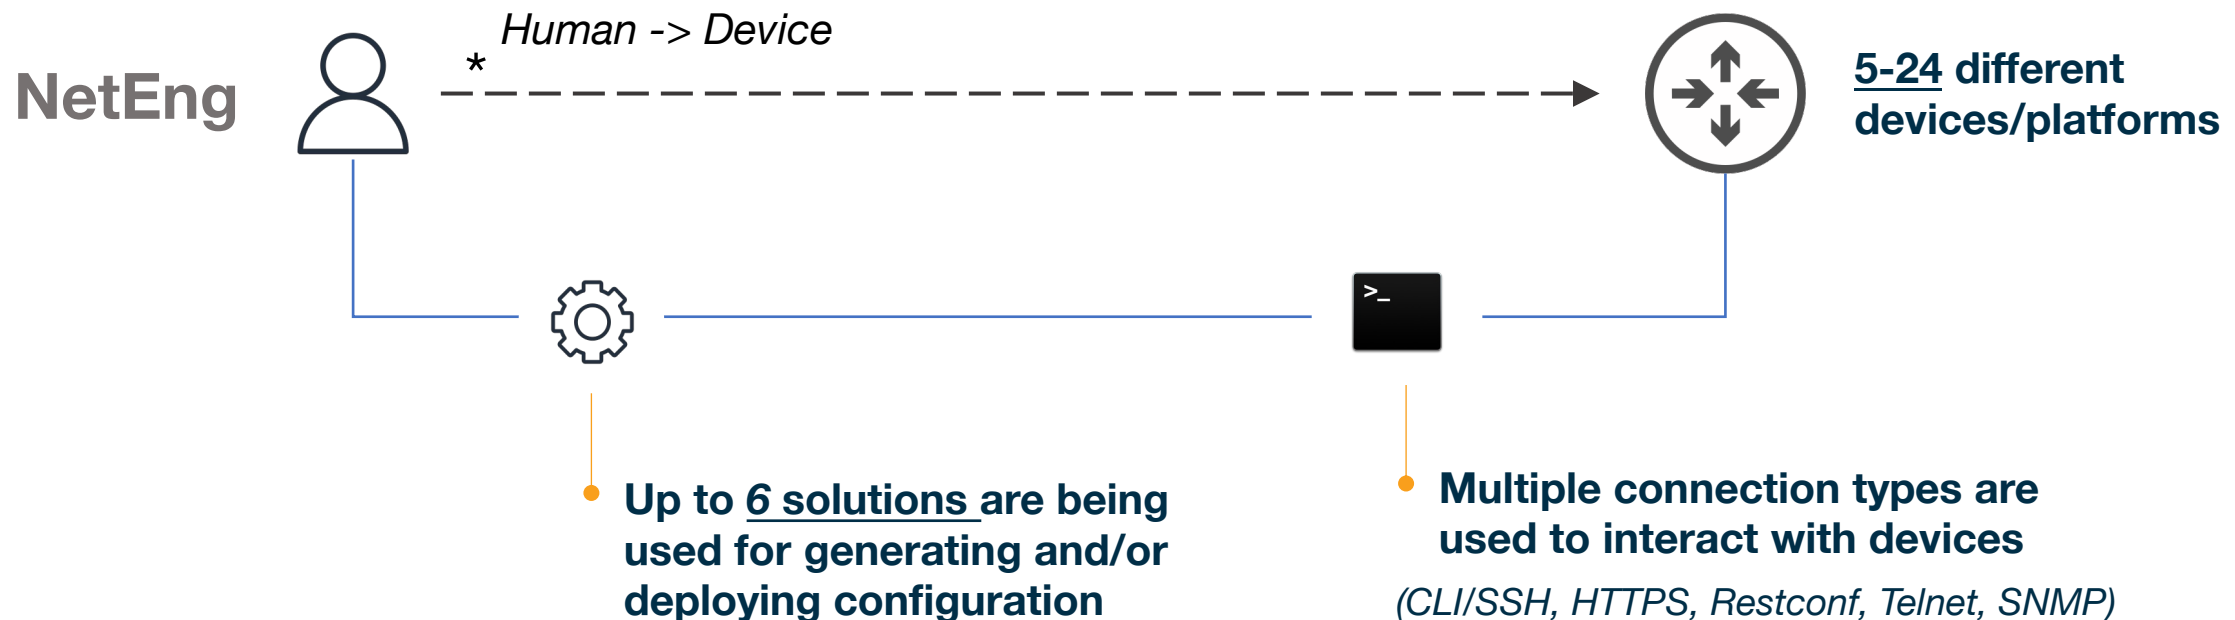

Network Management (*Historically*)

Complex [dictionary.com](https://www.dictionary.com)

“characterized by a very complicated or involved arrangement of parts, units, etc”

[NetDevOps - Survey](#)

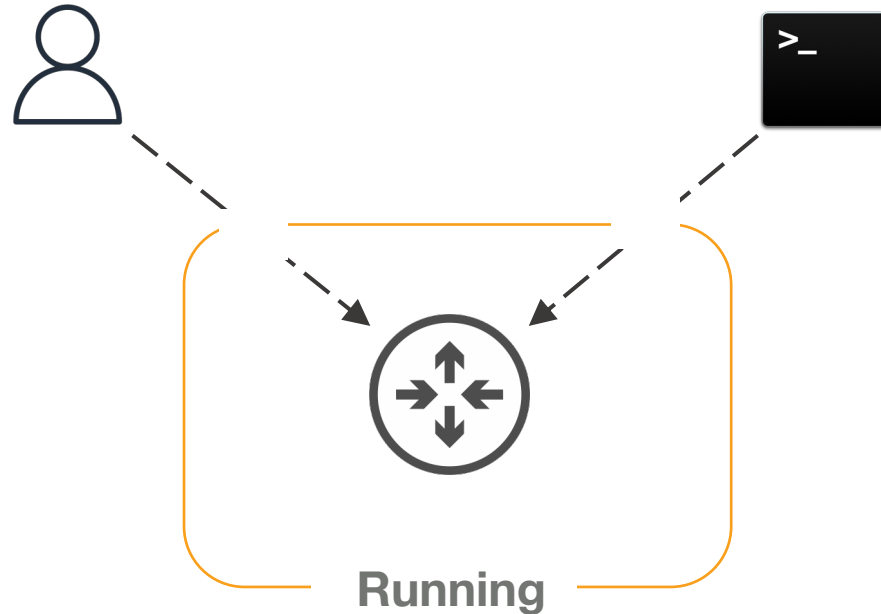

Network Management (*Historically*)

Runtime Automation (*Mutable*)

Deploy

Procure hardware,
install / cable, and apply
a base configuration

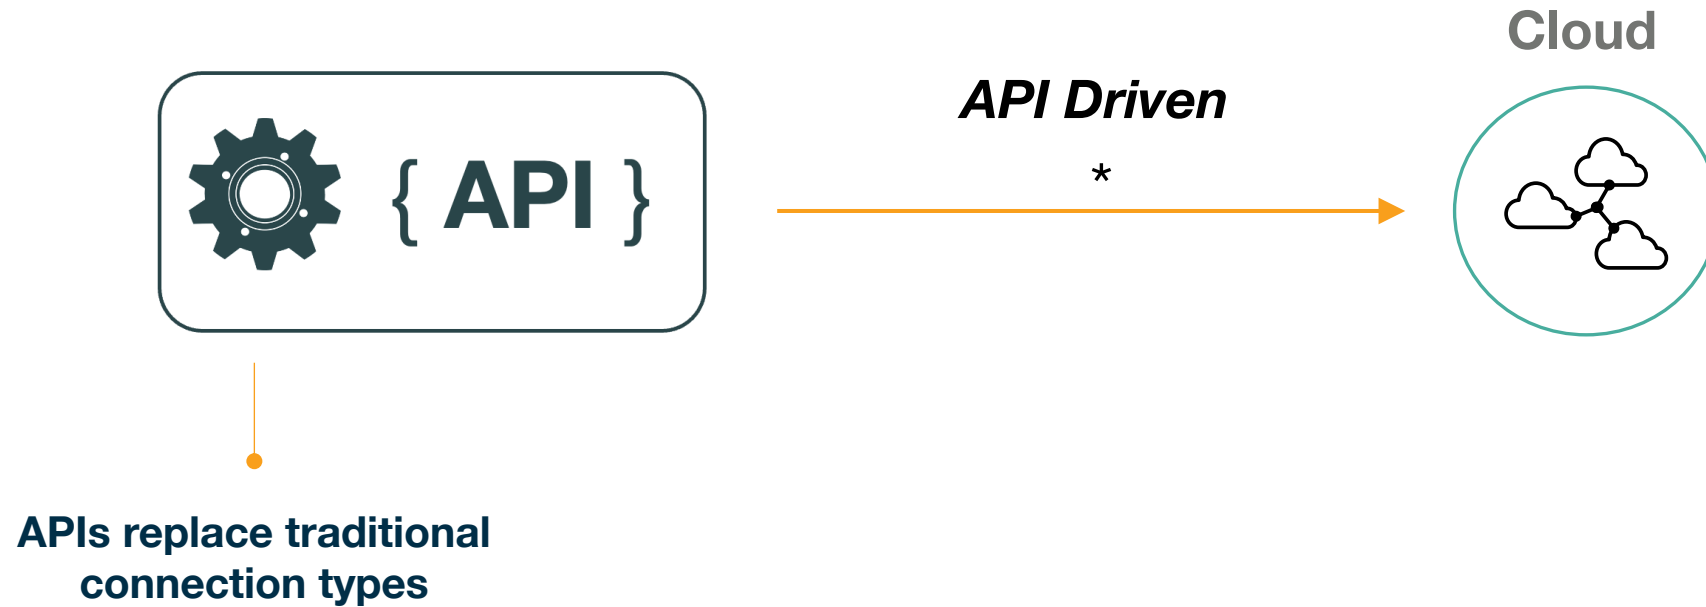

Automate

Configure, update, and
modify network
infrastructure "*in-place*"

Managing Cloud Networks *(Infrastructure-as-Code)*

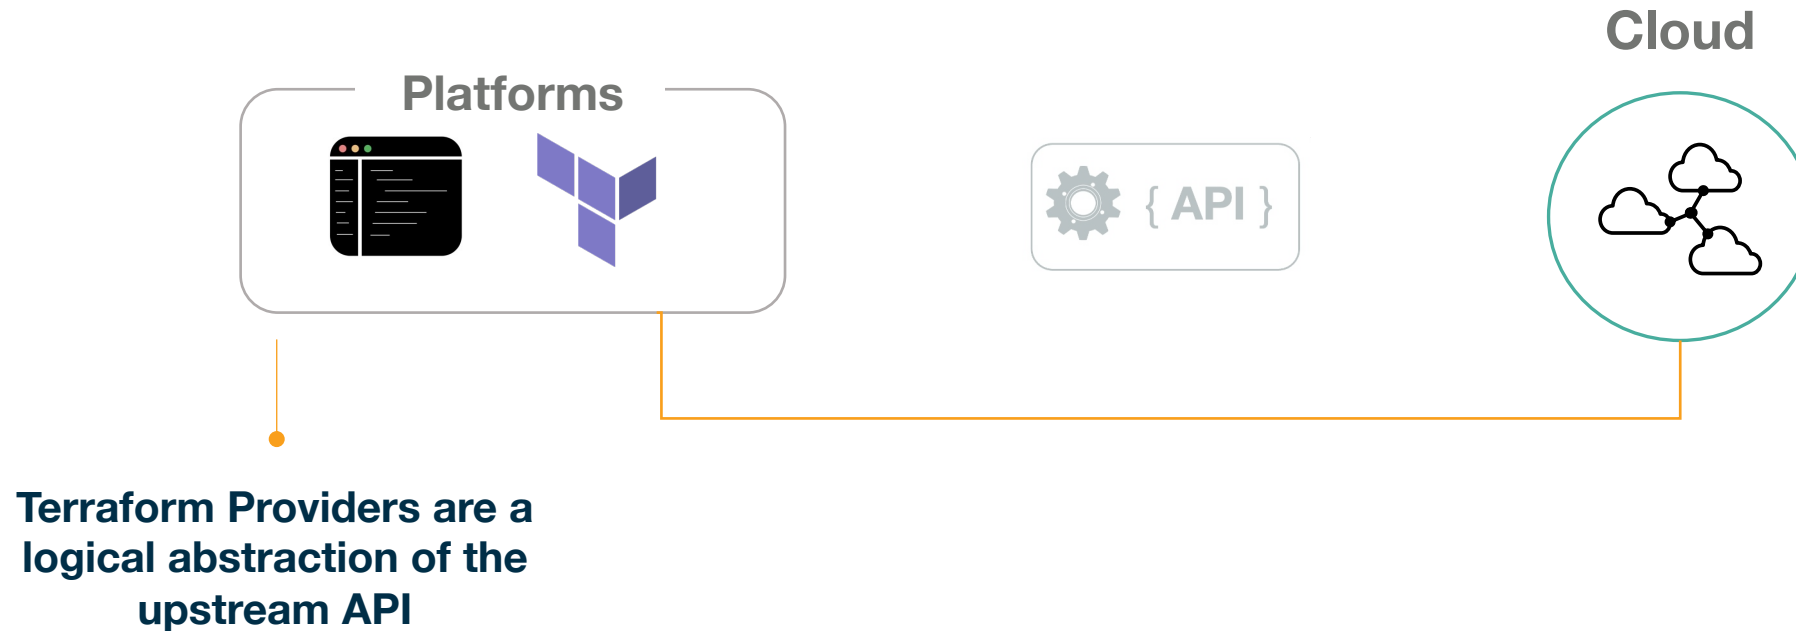

Network Management (Cloud)

New Connection Method

Network Management (*Cloud*)

Additional Abstractions

Network Management (*Cloud*)

Build-Time Automation (*Immutable*)

Codify

Describe the constructs and configuration using code files at *build-time*

Version (*git*)

Track, stage, and promote changes with consistency

CI/CD

Deploy networking “in-tact” using repeatable pipelines

Change Management

Traditional

- ✓ Oversight of changes to manually configured networks (*pre-cloud*)
- ✓ Ticket-Driven with a lengthy vetting process and extensive coordination
- ✓ Numerous teams receive tickets with varying dependencies / SLAs

Modern

- ✓ Oversight of changes to networks made via automation (*post-cloud*)
- ✓ Pipeline-Driven with automated and manual approvals
- ✓ Increased number of changes with smaller impact completed routinely

Network-*as-a-Service*

Building a Common *Foundation*

NaaS

Operate networking without the necessity of deploying and maintaining network infrastructure

Cloud

Sites

Users

Building a Common *Foundation*

Cloud Grade

Minimize operational friction by reducing touchpoints and interaction surfaces

Push

Pull

Provision

NaaS

Let's Build!
